GHG Emissions

6.1 Are you currently assessing your operational GHG emissions?

Yes

6.1.1 What GHG assessment tool or method are you currently using?

Agropalma is using RSPO Palm GHG Calculator Tool V2 to assess GHG balance. For the year of 2014, calculations resulted in an emission of -0.30 ton CO₂eq/ton of CPO, what means a net sequestration. This result considered the complete Land Use Change analysis and includes the sequestration of 2 tons of carbon per hectare per year in forest reserves belonged to Agropalma and its schemed FFB suppliers. Without considering carbon sink in forests reserves the result is 2.66 ton CO₂eq/ton of CPO. Past land use change and POME were the biggest sources of emissions. As it is not possible to include negative numbers in the item 6.2, it was left empty.

6.1.2 When do you plan to start assessing your operational GHG emissions in line with the requirements of C5.6?

--

6.2 What is your operational GHG emission value (tCO₂e/tCPO)? (refer to P&C C5.6)

--

6.3 What is the projected GHG emission associated with your new plantation development(s) (tCO₂e)? (refer to P&C C7.8)

--

The same happens with schemed smallholders and schemed outgrowers plantations. Besides taking care about its own production, Agropalma Group promotes RSPO among its clients and other growers by sharing its experiences (in Brazil and other countries of Latin America). Agropalma Group also engage NGOs and governmental agencies in the discussion about the sustainability of palm oil expansion in Brazil and highlights the importance of RSPO standard as the best guide to sustainability of palm oil production.
